Research Week 4 Day 1

<div align="center">Research</div>

1. What are the HTTP verbs and what do each correspond with?

    HEAD is one of the HTTP verbs. It is much like GET, but is used to retrieve specific
    metadata inside the body and not the entire body itself. GET is used to retrieve resources
    and can have modifiers to get partial bodies, etc. However, if not specified the whole
    body is returned when using GET. POST is the opposite of GET; it creates
    resources/allows bodies to be accessible. PATCH is a way to request a portion of the
    resource in order to update a portion of the attributes that reflect JSON data. It's generally
    used when there is only partial JSON data in a resource. PUT replaces resources or
    collections. When a resource has an empty body, the developer must specify the
    Content-Length header to zero. DELETE is used for deleting resources.
